

Material : steel (with high elastic limit)

- Notches : 4 at 90° spacing
- Screw(s) : Flat headed Hc (class 14.9)
- Standard finish :
- Right handed threads (class 4H) . Ground working face
- Engraved on reverse face . Blackened finish

Clamping key
Front tightening,
1 spring

Self-locking

Application

- The LF locking nut can be used wherever radial clamping is not possible. It is particularly recommended for components mounted inside holes or deep bores.
- The axial force created by the tightening of the screw is transmitted at 90° by the edges.
- The resulting radial force is applied to the clamping spring
- The contact surface perpendicular to the threaded side allows the adjustment and locking in place of different bearings or other mechanical elements requiring positioning under very precise tolerances.
- In addition to the lateral notches, the holes located on the front face allow positioning of the nut using a suitable spanner.

Info.

- * Following locking values were obtained for different sizes of locking screw
- M4 screw 2.5Nm torque • M5 screw 5Nm torque
- M6 screw 8 Nm torque • M8 screw 18Nm torque

Dimensions in mm

Advantages

- An accurate and strong solution for securing bearings in their axial position after installation.
- Locking washers are no longer required thus reducing the risk of seal damage.
- The rings can be clamped and locked in place with no loss of axial precision.
- Suitable for use in hostile environments (temperature, vibration etc...).
- All threading and contact face machining operations are performed in one operation to ensure that squareness and minimum run-out is guaranteed.

Typical application – Installation of a taper bearing on a machine tool spindle

Assembly

- The rings are screwed into position using an appropriately sized pin spanner (DIN 1810) on the lateral slots.
- To disassemble, simply unscrew.

Info.

- The values of locking torque and axial load given are for static assemblies. They are indicative purposes only and we decline any responsibility.
